

MOOV Software

cloud based software for vehicle access control

Key features:

- ✓ enabler for pre-book and multi-tenant parking, and (city)access control applications
- ✓ graphical control panel for monitoring and management of vehicle gates
- ✓ private cloud environment
- ✓ easy, simple and intuitive web-based user interface

The cloud based MOOV Software manages the MOOV VMC (Lite) for vehicle access. It is available at any time and from anywhere by authorized people. The user friendly graphical interface makes it easy to announce exemptions, create time schedules and manage access rights.

Dedicated access control modules

The MOOV Software consists of dedicated modules that provide advanced options for various vehicle access control applications:

Basic MOOV software; hosted software module for vehicle access control to manage access rights, credentials and graphical status information. Includes extensive event logs. This module can also be used to extend advance booking systems with physical access control barriers. Optional extensions are available.

Multi-tenant parking module; purpose built module to manage vehicle access control for office buildings, corporate sites & residential parking areas with multiple tenants. The capacity allocated to specific tenants can be determined and monitored. When the capacity is utilized fully, access is denied. The administration functionality enables management of the number of tenants as also the registration of tenants, counting groups, management of visitor templates and search functions.

City access module*; specific module for vehicle access control in cities. Includes the ability to view and manage access rights and redemptions, credentials, graphical status information and extensive event logs. Enables automatic synchronization with the MOOV controllers to enable them to operate standalone when offline.

Control panel

The control panel offers the possibility for security personnel and reception desks to do a basic daily control of a vehicle entrance. With the help of simple icons, users are informed about the status of the entire system. The control panel can be extended with camera images to give a complete and easy to use overview of the vehicle entrances.

Third-party interface

The third-party interface allows seamless integration of the MOOV platform into existing applications. Exchanging credentials and authorization rights is one of the possibilities of this interface.

Maintenance

The MOOV platform's detailed vehicle entrance logs enable remote entrance inspection. The optional service portal provides a real-time detailed overview of the status of the connected VMC's. Predefined actions be executed using soft buttons.

Software features

The MOOV Software contains advanced features, such as:

- Unlimited amount of exemptions, authorizations, persons, tenants, operation and events schedules
- Custom fields for end-user required information
- Set and define user rights within the MOOV application
- Detailed logging of all transaction at a vehicle entrance
- SOAP interface for third party integration CCTV integration

**module only available for certified partners. Please contact your Nedap representative for more information.*
